INDEX

Sr.no.	Practical	Date	Sign
1.	Data Pre-processing and Exploration a. Load a CSV dataset. Handle missing values, inconsistent formatting, and outliers. b. Load a dataset, calculate descriptive summary statistics, create visualizations using different graphs, and identify potential features and target variables Note: Explore Univariate and Bivariate graphs (Matplotlib) and Seaborn for visualization c. Create or Explore datasets to use all pre-processing routines like label encoding, scaling, and binarization.		
2.	Testing Hypothesis a. Implement and demonstrate the FIND-S algorithm for finding the most specific hypothesis based on a given set of training data samples. Read the training data from CSV file and generate the final specific hypothesis. (Create your dataset)		
3.	Linear Models a. Simple Linear Regression Fit a linear regression model on a dataset. Interpret coefficients, make predictions, and evaluate performance using metrics like R-squared and MSE b. Multiple Linear Regression Extend linear regression to multiple feature. Handle feature selection and potential multicollinearity c. Regualarized Linear Models Implement Regression variants like LASSO and Ridge on any generated dataset		
4.	Discriminative Models a. Logistic Regression : Perform binary classification using logistic regression. Calculate accuracy, precision, recall, and understand the ROC curve." b. Implement and demonstrate k-nearest Neighbor algorithm. Read the training data from a .CSV file and build the model to classify a test sample. Print both correct and wrong predictions. c. Build a decision tree classifier or regressor. Control hyperparameters like tree depth to avoid overfitting. Visualize the tree. d. Implement a Support Vector Machine for any relevant dataset. e. Train a random forest ensemble. Experiment with the number of trees and feature sampling. Compare performance to a single decision tree. f. Implement a gradient boosting machine (e.g., XGBoost). Tune hyperparameters and explore feature importance.		

5.	Generative Models a. Implement and demonstrate the working of a Naive Bayesian classifier using a sample data set. Build the model to classify a test sample. b. Implement Hidden Markov Models using hmmlearn		
6.	Probabilistic Models a. Implement Bayesian Linear Regression to explore prior and posterior distribution. b. Implement Gaussian Mixture Models for density estimation and unsupervised clustering.		
7.	Model Evaluation and Hyperparameter Tuning a. Implement cross-validation techniques (k-fold, stratified, etc.) for robust model evaluation b. Systematically explore combinations of hyperparameters to optimize model performance.(use grid and randomized search)		
8.	Bayesian Learning a. Implement Bayesian Learning using inferences		

Practical 1: Data Pre-processing and Exploration

1a. Load a CSV dataset. Handle missing values, inconsistent formatting, and outliers.

1. Import Libraries

 # Import necessary libraries

```
import pandas as pd

import numpy as np

import seaborn as sns

import matplotlib.pyplot as plt
```

2. Load the Dataset

 # Load the Titanic dataset from a URL

```
url = "https://raw.githubusercontent.com/datasciencedojo/datasets/master/titanic.csv" data
= pd.read_csv(url)
```

 # Display the first few rows

```
print(data.head())
```

3. Handle Missing Values

 # Check for missing values

```
print("Missing values in each column:")

print(data.isnull().sum())
```

 # Fill missing values in 'Age' with the mean

```
data['Age'].fillna(data['Age'].mean(), inplace=True)
```

 # Fill missing values in 'Embarked' with the most common value

```
data['Embarked'].fillna(data['Embarked'].mode()[0], inplace=True)
```

 # Drop rows where 'Cabin' is missing (too many NaNs)

```
data.drop(columns=['Cabin'], inplace=True)
```

 # Verify missing values are handled

```
print("\nAfter handling missing values:")

print(data.isnull().sum())
```

4. Fix Inconsistent Formatting

 # Fix inconsistent formatting in the 'Sex' column

```
data['Sex'] = data['Sex'].str.lower().str.strip()
```

 # Verify unique values

```
print("\nUnique values in 'Sex' column after formatting:")
print(data['Sex'].unique())
```

5. Detect and Handle Outliers

 # Boxplot for the 'Fare' column

```
sns.boxplot(data['Fare'], color='skyblue')
plt.title('Boxplot of Fare')
plt.show()
```

 # Detect outliers using the IQR method

```
Q1 = data['Fare'].quantile(0.25)
Q3 = data['Fare'].quantile(0.75)
IQR = Q3 - Q1
lower_bound = Q1 - 1.5 * IQR
upper_bound = Q3 + 1.5 * IQR
```

 # Capping outliers

```
data['Fare'] = np.where(data['Fare'] > upper_bound, upper_bound,  np.where(data['Fare'] < lower_bound, lower_bound, data['Fare']))
# Verify with an updated boxplot
sns.boxplot(data['Fare'], color='lightgreen')
plt.title('Boxplot of Fare (After Handling Outliers)')
plt.show()
```

6. Save the Cleaned Dataset

 # Save the cleaned dataset

```
data.to_csv('cleaned_titanic.csv', index=False)
print("\nCleaned dataset saved as 'cleaned_titanic.csv'") .
```

1b. Load a dataset, calculate descriptive summary statistics, create visualizations using different graphs, and identify potential features and target variables Note:
Explore Univariate and Bivariate graphs (Matplotlib) and Seaborn for visualization

1. Import Necessary Libraries

 # Import required libraries

```
import pandas as pd

import numpy as np

import matplotlib.pyplot as plt

import seaborn as sns
```

2. Load the Dataset

 # Load the dataset from the URL

```
url = "https://raw.githubusercontent.com/mwaskom/seaborn-data/master/iris.csv" data = pd.read_csv(url)
```

 # Display the first few rows

```
print("First 5 rows of the dataset:")

print(data.head())
```

3. Calculate Descriptive Summary Statistics

 # Dataset information

```
print("\nDataset Info:")

print(data.info())
```

 # Summary statistics for numerical columns

```
print("\nDescriptive Statistics for Numerical Columns:")

print(data.describe())
```

 # Check unique values for categorical columns

```
print("\nUnique values in 'species' column:")

print(data['species'].value_counts())
```

4. Univariate Analysis

 # Histograms for numerical columns

```
data.hist(figsize=(10, 8), color='skyblue', edgecolor='black')

plt.suptitle("Histograms of Numerical Features")

plt.show()
```

 # Bar plot for 'species' column

```
sns.countplot(x='species', data=data, palette='pastel')

plt.title("Count of Each Species")

plt.show()
```

5. Bivariate Analysis

 # Scatter plot for two features

```
plt.figure(figsize=(8, 6))

plt.scatter(data['sepal_length'], data['sepal_width'], alpha=0.7, c='blue') plt.title("Sepal Length vs Sepal Width")

plt.xlabel("Sepal  Length")

plt.ylabel("Sepal  Width")

plt.show()
```

 # Pairplot to visualize relationships between features

```
sns.pairplot(data, hue='species', palette='husl', diag_kind='kde')

plt.suptitle("Pairplot of Features by Species", y=1.02)

plt.show()
```

 # Boxplot for petal_length across species

```
sns.boxplot(x='species', y='petal_length', data=data, palette='Set3')

plt.title("Boxplot of Petal Length by Species")

plt.show()
```

6. Identify Potential Features and Target Variables

 # Separate features and target

```
features = data.drop(columns=['species']) # Drop the target column
```

target = data['species'] # Target variable

print("\nFeatures:")

print(features.head())

print("\nTarget:")

print(target.head())

 # Visualize target distribution

sns.countplot(x=target, palette='viridis')

plt.title("Target Variable Distribution")

plt.show()

7. Save the Cleaned and Processed Dataset

 # Save the dataset

data.to_csv('processed_iris.csv', index=False) print("\nProcessed dataset saved as 'processed_iris.csv'")

1c. Create or Explore datasets to use all pre-processing routines like label encoding, scaling, and binarization.

1. Import Necessary Libraries

 # Import required libraries

```
import pandas as pd

import numpy as np

from sklearn.preprocessing import LabelEncoder, MinMaxScaler, StandardScaler, Binarizer
```

2. Create or Load a Dataset

 # Create a sample dataset

```
data = pd.DataFrame({

 'Category': ['A', 'B', 'C', 'A', 'B', 'C'], # Categorical variable

 'Age': [23, 45, 31, 22, 35, 30], # Numerical variable

 'Income': [50000, 60000, 70000, 80000, 90000, 100000], # Numerical variable  'Has_Car': ['Yes', 'No', 'Yes', 'No', 'Yes', 'No'] # Binary categorical variable })
```

 # Display the dataset

```
print("Sample Dataset:")

print(data)
```

3. Apply Pre-Processing Routines

 # Label Encoding for 'Category' column

```
label_encoder = LabelEncoder()

data['Category_Encoded'] = label_encoder.fit_transform(data['Category'])

# Label Encoding for binary column 'Has_Car'

data['Has_Car_Encoded'] = label_encoder.fit_transform(data['Has_Car'])

print("\nAfter Label Encoding:")

print(data)
```

 # Min-Max Scaling for 'Income'

```
min_max_scaler = MinMaxScaler()

data['Income_MinMax'] = min_max_scaler.fit_transform(data[['Income']]) # Standard Scaling for 'Age'
```

```
standard_scaler = StandardScaler()
data['Age_Standardized'] = standard_scaler.fit_transform(data[['Age']])
print("\nAfter Scaling:")
print(data)
```

 # Binarization for 'Income' with a threshold of 75,000

```
binarizer = Binarizer(threshold=75000)
data['Income_Binary'] = binarizer.fit_transform(data[['Income']])
print("\nAfter Binarization:")
print(data)
```

4. Save the Processed Dataset

 # Save the processed dataset

```
data.to_csv('processed_data.csv', index=False)
print("\nProcessed dataset saved as 'processed_data.csv'")
```

```
Sample Dataset:
  Category  Age  Income Has_Car
0        A   23   50000     Yes
1        B   45   60000      No
2        C   31   70000     Yes
3        A   22   80000      No
4        B   35   90000     Yes
5        C   30  100000      No
```

```
After Label Encoding:
  Category  Age  Income Has_Car  Category_Encoded  Has_Car_Encoded
0        A   23   50000     Yes                 0                1
1        B   45   60000      No                 1                0
2        C   31   70000     Yes                 2                1
3        A   22   80000      No                 0                0
4        B   35   90000     Yes                 1                1
5        C   30  100000      No                 2                0
```

```
After Scaling:
  Category  Age  Income Has_Car  Category_Encoded  Has_Car_Encoded  \
0        A   23   50000     Yes                 0                1
1        B   45   60000      No                 1                0
2        C   31   70000     Yes                 2                1
3        A   22   80000      No                 0                0
4        B   35   90000     Yes                 1                1
5        C   30  100000      No                 2                0

   Income_MinMax  Age_Standardized

5            1.0         -0.129460              1
```

2: Testing Hypothesis

AIM: Implement and demonstrate the FIND-S algorithm for finding the most specific hypothesis based on a given set of training data samples. Read the training data from a. CSV file and generate the final specific hypothesis. (Create your dataset)

1. Import Necessary Libraries

 # Import required libraries

```
import pandas as pd
import numpy as np
```

2. Create the Dataset and Save it as CSV

```
# Create a synthetic dataset
data = {
 'Sky': ['Sunny', 'Sunny', 'Rainy', 'Sunny', 'Rainy'],
 'Temperature': ['Warm', 'Cold', 'Warm', 'Warm', 'Cold'],
 'Humidity': ['Normal', 'High', 'High', 'Normal', 'Normal'],
 'Wind': ['Strong', 'Strong', 'Weak', 'Strong', 'Weak'],
 'Water': ['Warm', 'Warm', 'Cool', 'Warm', 'Cool'],
 'Forecast': ['Same', 'Same', 'Change', 'Same', 'Change'],
 'Condition': ['Yes', 'No', 'No', 'Yes', 'No'] # Target variable
}
# Convert the dataset to a DataFrame
df = pd.DataFrame(data)
# Save the dataset to a CSV file
df.to_csv('training_data.csv', index=False)
# Display the dataset
print("Dataset:")
print(df)
```

3. Load the Dataset

 # Load the dataset from CSV

```
dataset = pd.read_csv('training_data.csv')
```

 # Display the dataset

print("\nLoaded Dataset:")

print(dataset)

4. Define the FIND-S Algorithm

def find_s(training_data):

 # Extract the features and target

features = training_data.iloc[:, :-1].values # All columns except the last

target = training_data.iloc[:, -1].values # Last column (target variable)

Initialize the most specific hypothesis

hypothesis = ['Ø'] * features.shape[1]

 # Iterate through each example in the dataset

for i, example in enumerate(features):

if target[i] == 'Yes': # Consider only positive examples for j in range(len(hypothesis)):

if hypothesis[j] == 'Ø': # Update the hypothesis initially hypothesis[j] = example[j]

elif hypothesis[j] != example[j]: # Generalize if inconsistent hypothesis[j] = '?'

return hypothesis

5. Run the FIND-S Algorithm

 # Apply the FIND-S algorithm

final_hypothesis = find_s(dataset)

 # Display the final specific hypothesis

print("\nFinal Specific Hypothesis:")

print(final_hypothesis)

```
Dataset:
      Sky Temperature Humidity    Wind Water Forecast Condition
0   Sunny        Warm   Normal  Strong  Warm     Same       Yes
1   Sunny        Cold     High  Strong  Warm     Same        No
2   Rainy        Warm     High    Weak  Cool   Change        No
3   Sunny        Warm   Normal  Strong  Warm     Same       Yes
4   Rainy        Cold   Normal    Weak  Cool   Change        No
```

```
Loaded Dataset:
     Sky Temperature Humidity    Wind Water Forecast Condition
0  Sunny        Warm   Normal  Strong  Warm     Same       Yes
1  Sunny        Cold     High  Strong  Warm     Same        No
2  Rainy        Warm     High    Weak  Cool   Change        No
3  Sunny        Warm   Normal  Strong  Warm     Same       Yes
4  Rainy        Cold   Normal    Weak  Cool   Change        No
```

```
Final Specific Hypothesis:
['Sunny', 'Warm', 'Normal', 'Strong', 'Warm', 'Same']
```

3. Linear Models

3a. Simple Linear Regression

Fit a linear regression model on a dataset. Interpret coefficients, make predictions, and evaluate performance using metrics like R-squared and MSE

Step 1: Import Libraries

 # Import required libraries

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
from sklearn.model_selection import train_test_split
from sklearn.linear_model import LinearRegression
from sklearn.metrics import mean_squared_error, r2_score
```

Step 2: Create a Dataset and Save as CSV

 # Create a sample dataset

```
data = {
   'House_Size': [750, 800, 850, 900, 1000, 1100, 1200, 1300, 1400, 1500],
   'Price': [150000, 160000, 165000, 170000, 180000, 190000, 200000, 210000, 220000, 230000]
}
```

 # Convert the dataset into a DataFrame

```
df = pd.DataFrame(data)
```

 # Save to CSV file

```
df.to_csv('house_prices.csv', index=False)
```

 # Display the dataset

```
print("Dataset:")
print(df)
```

Step 3: Load the Dataset

```
# Load the dataset
dataset = pd.read_csv('house_prices.csv')
# Display the first few rows
print("\nLoaded Dataset:")
print(dataset.head())
```

Step 4: Split the Dataset into Training and Test Sets

```
# Features and target variable
X = dataset[['House_Size']]  # Feature: House size
y = dataset['Price']        # Target: Price
# Split data into training and testing sets (80% train, 20% test)
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)
print("\nTraining and Testing Data Sizes:")
print("Training Data Size:", X_train.shape[0])
print("Testing Data Size:", X_test.shape[0])
```

Step 5: Fit a Linear Regression Model

```
# Initialize and fit the linear regression model
model = LinearRegression()
model.fit(X_train, y_train)
# Display the coefficients
print("\nModel Coefficients:")
print("Slope (m):", model.coef_[0])
print("Intercept (b):", model.intercept_)
```

Step 6: Make Predictions

```
# Predict on the test set
y_pred = model.predict(X_test)
```

 # Display predictions

```
print("\nPredictions on Test Data:")
print("Actual Prices:", y_test.values)
print("Predicted Prices:", y_pred)
```

Step 7: Evaluate the Model

 # Calculate evaluation metrics

```
mse = mean_squared_error(y_test, y_pred)
r2 = r2_score(y_test, y_pred)
```

 # Display metrics

```
print("\nModel Performance Metrics:")
print("Mean Squared Error (MSE):", mse)
print("R-squared (R²):", r2)
```

Step 8: Visualize the Results

 # Scatter plot of the training data

```
plt.scatter(X_train, y_train, color='blue', label='Training Data')
```

 # Plot the regression line

```
plt.plot(X_train, model.predict(X_train), color='red', label='Regression Line')
```

 # Scatter plot of the test data

```
plt.scatter(X_test, y_test, color='green', label='Test Data')
plt.title("Simple Linear Regression")
plt.xlabel("House Size (sq ft)")
plt.ylabel("Price ($)")
plt.legend()
plt.show()
```

3b. Multiple Linear Regression

Extend linear regression to multiple feature. Handle feature selection and potential multicollinearity

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
from sklearn.model_selection import train_test_split
from sklearn.linear_model import LinearRegression
from sklearn.metrics import mean_squared_error, r2_score
from statsmodels.stats.outliers_influence import variance_inflation_factor
from sklearn.preprocessing import LabelEncoder  # Import LabelEncoder
from sklearn.impute import SimpleImputer

# Load dataset
from google.colab import files
uploaded = files.upload()  # Upload your CSV file
# Read the CSV file
data = pd.read_csv(list(uploaded.keys())[0])
# Display the first few rows
print(data.head())
# Check for null values and basic statistics
print(data.info())
print(data.describe())
# Define a function to calculate VIF
def calculate_vif(df):
# Select only numeric features for VIF calculation
 numeric_df = df.select_dtypes(include=np.number)
```

```
    # Drop rows with infinite or missing values
    numeric_df = numeric_df.replace([np.inf, -np.inf], np.nan).dropna()
    vif_data = pd.DataFrame()
    vif_data["feature"] = numeric_df.columns
    vif_data["VIF"] = [variance_inflation_factor(numeric_df.values, i) for i in
range(numeric_df.shape[1])]
    return vif_data
# Selecting features and target variable
X = data.drop("Survived", axis=1)  # Changed 'y' to 'Survived'
y = data["Survived"]
# Handle categorical features (e.g., using Label Encoding)
for col in X.select_dtypes(include=['object']).columns:
    le = LabelEncoder()
    X[col] = le.fit_transform(X[col])
# Impute missing values using the mean (you can choose other strategies)
imputer = SimpleImputer(strategy='mean') # Create an imputer instance
X = pd.DataFrame(imputer.fit_transform(X), columns=X.columns) # Impute and update X
# Calculate VIF for initial features
print("VIF before handling multicollinearity:")
print(calculate_vif(X)) # Call the modified function
# Drop features based on VIF analysis (example: drop 'X1' if VIF is high)
# Check if the column exists before dropping
if 'X1' in X.columns:
    X = X.drop("X1", axis=1)  # Replace 'X1' with the actual high VIF feature name
else:
    print("Column 'X1' not found in the DataFrame.")
# Recalculate VIF

3c. Regualarized Linear Models

Implement Regression variants like LASSO and Ridge on any generated dataset

1. Set Up the Environment

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
from sklearn.model_selection import train_test_split
from sklearn.linear_model import Ridge, Lasso, ElasticNet
from sklearn.metrics import mean_squared_error, r2_score
from sklearn.datasets import make_regression
# Set random seed for reproducibility
np.random.seed(42)
```

2. Generate a Synthetic Dataset

```
# Generate synthetic data
X, y = make_regression(
    n_samples=1000,  # Number of samples
    n_features=10,  # Number of features
    noise=15,       # Add some noise
    random_state=42
)
# Convert to DataFrame for exploration
data = pd.DataFrame(X, columns=[f"X{i}" for i in range(1, 11)])
data["y"] = y
# Display the first few rows
print(data.head())
```

3. Split the Dataset

```
# Split data into training and testing sets
X_train, X_test, y_train, y_test = train_test_split(
    data.drop("y", axis=1),  # Features
    data["y"],               # Target variable
    test_size=0.2,           # 20% for testing
    random_state=42
)
```

4. Train and Evaluate Ridge Regression

```
# Initialize Ridge Regression with a regularization parameter (alpha)
ridge = Ridge(alpha=1.0)
# Train the model
ridge.fit(X_train, y_train)
# Predictions
ridge_pred = ridge.predict(X_test)
# Evaluate Ridge Regression
ridge_rmse = np.sqrt(mean_squared_error(y_test, ridge_pred))
ridge_r2 = r2_score(y_test, ridge_pred)
print(f"Ridge RMSE: {ridge_rmse}")
print(f"Ridge R^2: {ridge_r2}")
```

5. Train and Evaluate Lasso Regression

```
# Initialize Lasso Regression
lasso = Lasso(alpha=0.1)
# Train the model
lasso.fit(X_train, y_train)
# Predictions
lasso_pred = lasso.predict(X_test)
# Evaluate Lasso Regression
```

```
lasso_rmse = np.sqrt(mean_squared_error(y_test, lasso_pred))
lasso_r2 = r2_score(y_test, lasso_pred)
print(f"Lasso RMSE: {lasso_rmse}")
print(f"Lasso R^2: {lasso_r2}")
# Features shrunk to zero
print("Lasso Coefficients:", lasso.coef_)
```

6. Train and Evaluate ElasticNet Regression

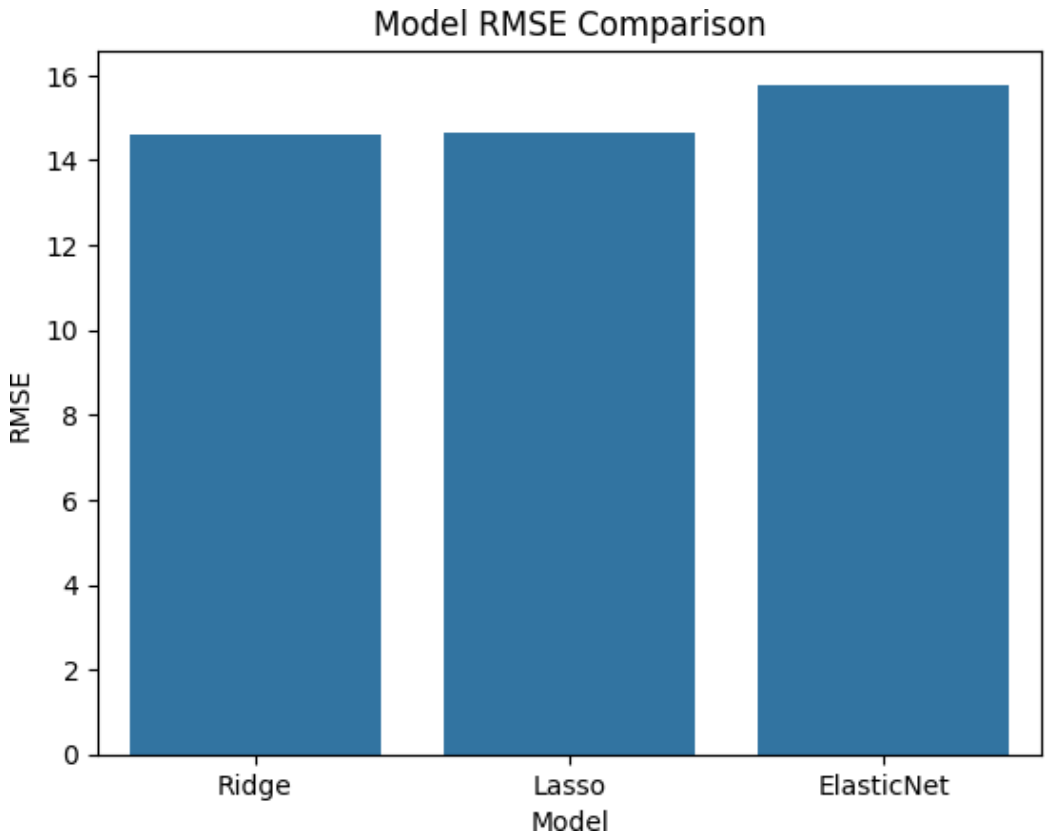
```
# Initialize ElasticNet
elastic_net = ElasticNet(alpha=0.1, l1_ratio=0.5)  # l1_ratio balances L1 and L2 penalties
# Train the model
elastic_net.fit(X_train, y_train)
# Predictions
elastic_net_pred = elastic_net.predict(X_test)
# Evaluate ElasticNet Regression
elastic_net_rmse = np.sqrt(mean_squared_error(y_test, elastic_net_pred))
elastic_net_r2 = r2_score(y_test, elastic_net_pred)
print(f"ElasticNet RMSE: {elastic_net_rmse}")
print(f"ElasticNet R^2: {elastic_net_r2}")
```

7. Compare Results

```
# Collect metrics
metrics = pd.DataFrame({
    "Model": ["Ridge", "Lasso", "ElasticNet"],
    "RMSE": [ridge_rmse, lasso_rmse, elastic_net_rmse],
    "R^2": [ridge_r2, lasso_r2, elastic_net_r2]
})
print(metrics)
```

 # Plot RMSE comparison

```
sns.barplot(data=metrics, x="Model", y="RMSE")
plt.title("Model RMSE Comparison")
plt.show()
```



4. Discriminative Models

4a. Logistic Regression : Perform binary classification using logistic regression. Calculate accuracy, precision, recall, and understand the ROC curve."

Step 1: Import Required Libraries

```
# Import necessary libraries
import numpy as np
import pandas as pd
from sklearn.model_selection import train_test_split
from sklearn.linear_model import LogisticRegression
from sklearn.metrics import accuracy_score, precision_score, recall_score, roc_curve, auc
import matplotlib.pyplot as plt
```

Step 2: Prepare the Dataset

```
from sklearn.datasets import make_classification
# Create a synthetic dataset
X, y = make_classification(n_samples=1000, n_features=10, n_classes=2, random_state=42)
# Split data into training and testing sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.3, random_state=42)
```

Step 3: Train the Logistic Regression Model

```
# Initialize the logistic regression model
logreg = LogisticRegression()
# Train the model on the training data
logreg.fit(X_train, y_train)
```

Step 4: Make Predictions

```
# Predict labels for the test set
y_pred = logreg.predict(X_test)
# Predict probabilities for the ROC curve
y_prob = logreg.predict_proba(X_test)[:, 1]
```

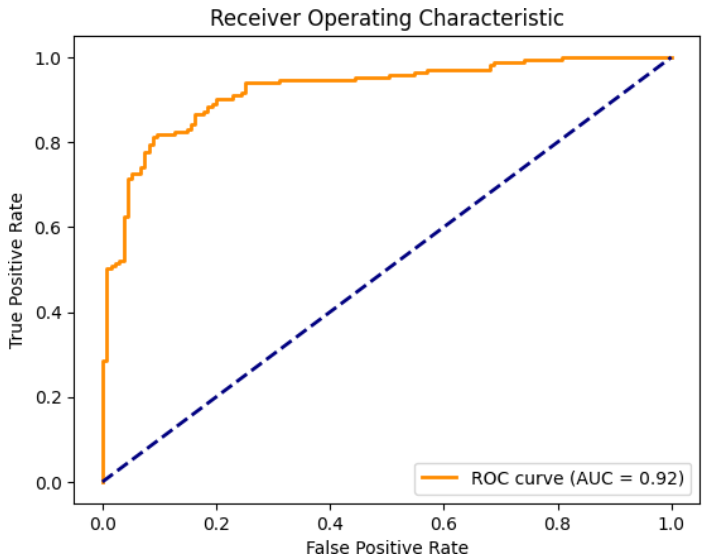
Step 5: Evaluate the Model

```
# Calculate metrics
```

```
accuracy = accuracy_score(y_test, y_pred)
precision = precision_score(y_test, y_pred)
recall = recall_score(y_test, y_pred)
print(f"Accuracy: {accuracy:.2f}")
print(f"Precision: {precision:.2f}")
print(f"Recall: {recall:.2f}")
```

Step 6: Plot the ROC Curve

```
# Compute ROC curve and AUC
fpr, tpr, _ = roc_curve(y_test, y_prob)
roc_auc = auc(fpr, tpr)
# Plot the ROC curve
plt.figure()
plt.plot(fpr, tpr, color='darkorange', lw=2, label=f"ROC curve (AUC = {roc_auc:.2f})")
plt.plot([0, 1], [0, 1], color='navy', lw=2, linestyle='--')
plt.xlabel('False Positive Rate')
plt.ylabel('True Positive Rate')
plt.title('Receiver Operating Characteristic')
plt.legend(loc="lower right")
plt.show()
```



4b .Implement and demonstrate k-nearest Neighbor algorithm. Read the training data from a .CSV file and build the model to classify a test sample. Print both correct and wrong predictions.

Step 1: Import Required Libraries

```
# Import necessary libraries
import pandas as pd
import numpy as np
from sklearn.model_selection import train_test_split
from sklearn.neighbors import KNeighborsClassifier
from sklearn.metrics import accuracy_score
from google.colab import files
```

Step 2: Create or Upload the CSV File

```
# Check if the user wants to create a dataset or upload one
print("Do you have a CSV file to upload? (yes/no)")
response = input().lower()
if response == "yes":
    uploaded = files.upload()
    filename = list(uploaded.keys())[0]
else:
    # Create a synthetic dataset
    from sklearn.datasets import make_classification
    # Generate synthetic data
    X, y = make_classification(
        n_samples=200, n_features=5, n_classes=2, random_state=42
    )
    # Combine features and target into a single DataFrame
    data = pd.DataFrame(X, columns=[f"Feature_{i}" for i in range(X.shape[1])])
    data['Target'] = y
```

```
# Save the dataset to a CSV file
filename = "synthetic_data.csv"
data.to_csv(filename, index=False)
print(f"Synthetic dataset saved as {filename}.")
```

Step 3: Load the CSV File into a DataFrame

```
# Load the dataset into a DataFrame
data = pd.read_csv(filename)
# Display the first few rows of the dataset
print("Loaded Dataset:")
print(data.head())
```

Step 4: Preprocess the Data

```
# Separate features (X) and labels (y)
X = data.iloc[:, :-1].values  # All columns except the last one
y = data.iloc[:, -1].values   # Last column as the target
# Split the dataset into training and testing sets (80% train, 20% test)
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)
```

Step 5: Train the k-NN Model

```
# Initialize the k-NN model with k=3
knn = KNeighborsClassifier(n_neighbors=3)
# Train the model on the training data
knn.fit(X_train, y_train)
```

Step 6: Predict Test Samples

```
# Predict the labels for the test set
y_pred = knn.predict(X_test)
```

Step 7: Evaluate and Print Predictions

```
# Calculate and display the accuracy
accuracy = accuracy_score(y_test, y_pred)
print(f"\nModel Accuracy: {accuracy:.2f}\n")
# Display correct and incorrect predictions
print("Correct Predictions:")
for i in range(len(y_test)):
    if y_pred[i] == y_test[i]:
        print(f"Sample {i}: Predicted={y_pred[i]}, Actual={y_test[i]}")
print("\nIncorrect Predictions:")
for i in range(len(y_test)):
    if y_pred[i] != y_test[i]:
        print(f"Sample {i}: Predicted={y_pred[i]}, Actual={y_test[i]}")
```

Output :

```
[ ]
Model Accuracy: 0.88

Correct Predictions:
Sample 0: Predicted=0, Actual=0
Sample 1: Predicted=1, Actual=1
Sample 2: Predicted=1, Actual=1
Sample 3: Predicted=0, Actual=0
Sample 4: Predicted=1, Actual=1
Sample 5: Predicted=1, Actual=1
Sample 6: Predicted=0, Actual=0
Sample 7: Predicted=0, Actual=0
Sample 9: Predicted=1, Actual=1

Sample 13: Predicted=0, Actual=0
Sample 14: Predicted=0, Actual=0
Sample 15: Predicted=0, Actual=0
Sample 16: Predicted=0, Actual=0
Sample 17: Predicted=1, Actual=1
Sample 18: Predicted=1, Actual=1
Sample 19: Predicted=0, Actual=0
Sample 20: Predicted=0, Actual=0
Sample 22: Predicted=1, Actual=1
Sample 23: Predicted=1, Actual=1
Sample 24: Predicted=1, Actual=1
Sample 25: Predicted=1, Actual=1
Sample 26: Predicted=1, Actual=1
Sample 27: Predicted=0, Actual=0
Sample 28: Predicted=0, Actual=0
Sample 30: Predicted=1, Actual=1
Sample 31: Predicted=1, Actual=1
Sample 32: Predicted=1, Actual=1
Sample 34: Predicted=0, Actual=0
Sample 35: Predicted=1, Actual=1
Sample 36: Predicted=1, Actual=1
Sample 38: Predicted=1, Actual=1
Sample 39: Predicted=1, Actual=1
```

```
Incorrect Predictions:
Sample 8: Predicted=1, Actual=0
Sample 21: Predicted=1, Actual=0
Sample 29: Predicted=0, Actual=1
Sample 33: Predicted=1, Actual=0
Sample 37: Predicted=1, Actual=0
```

4c. Build a decision tree classifier or regressor. Control hyperparameters like tree depth to avoid overfitting. Visualize the tree.

Step 1: Import Required Libraries

```
# Import necessary libraries
import pandas as pd
import numpy as np
from sklearn.model_selection import train_test_split
from sklearn.tree import DecisionTreeClassifier, DecisionTreeRegressor, plot_tree
from sklearn.metrics import accuracy_score, mean_squared_error
import matplotlib.pyplot as plt
from google.colab import files
```

Step 2: Create or Upload the CSV File

```
# Check if the user wants to upload a file or generate one
print("Do you have a CSV file to upload? (yes/no)")
response = input().lower()
if response == "yes":
    # Upload the CSV file
    uploaded = files.upload()
    filename = list(uploaded.keys())[0]
else:
    # Generate synthetic data (classification or regression)
    from sklearn.datasets import make_classification, make_regression
    print("Choose a task: (1) Classification (2) Regression")
    task = int(input())
    if task == 1:
    # Generate synthetic classification data
        X, y = make_classification(n_samples=200, n_features=5, random_state=42)
        task_type = "classification"
```

```
    else:
        # Generate synthetic regression data
        X, y = make_regression(n_samples=200, n_features=5, random_state=42)
        task_type = "regression"
    # Combine features and target into a single DataFrame
    data = pd.DataFrame(X, columns=[f"Feature_{i}" for i in range(X.shape[1])])
    data['Target'] = y
    # Save the dataset to a CSV file
    filename = "synthetic_data.csv"
    data.to_csv(filename, index=False)
    print(f"Synthetic {task_type} dataset saved as {filename}.")
```

Step 3: Load the Dataset

```
# Load the dataset
data = pd.read_csv(filename)
# Display the first few rows of the dataset
print("Dataset Preview:")
print(data.head())
```

Step 4: Preprocess the Data

```
# Separate features and target
X = data.iloc[:, :-1].values  # All columns except the last one
y = data.iloc[:, -1].values   # Last column as the target
# Split data into training and testing sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)
```

Step 5: Build the Decision Tree

```
# Define the tree depth to avoid overfitting
max_depth = 3
```

 # Initialize the model

```
if task_type == "classification":
    model = DecisionTreeClassifier(max_depth=max_depth, random_state=42)
else:
    model = DecisionTreeRegressor(max_depth=max_depth, random_state=42)
```

 # Train the model

```
model.fit(X_train, y_train)
```

Step 6: Make Predictions

 # Predict on the test set

```
y_pred = model.predict(X_test)
```

 # Evaluate the model

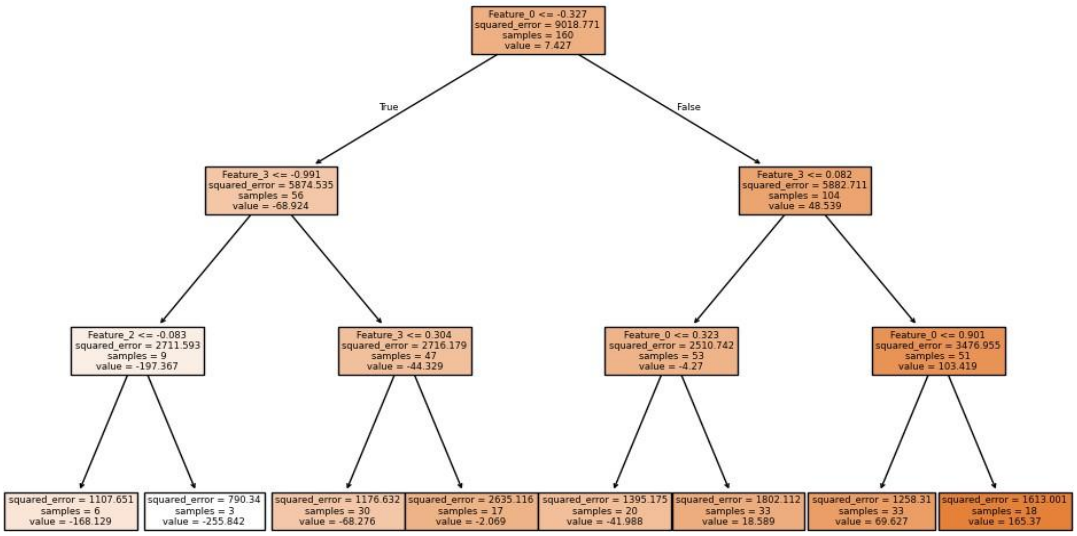
```
if task_type == "classification":
    accuracy = accuracy_score(y_test, y_pred)
    print(f"Accuracy: {accuracy:.2f}")
else:
    mse = mean_squared_error(y_test, y_pred)
    print(f"Mean Squared Error: {mse:.2f}")
```

Step 7: Visualize the Tree

 # Visualize the decision tree

```
plt.figure(figsize=(12, 8))
plot_tree(model, feature_names=data.columns[:-1], class_names=str(np.unique(y)) if task_type == "classification" else None, filled=True)
plt.title("Decision Tree Visualization")
plt.show()
```

Decision Tree Visualization



4d. Implement a Support Vector Machine for any relevant dataset.

Step 1: Import Required Libraries

```
# Import necessary libraries
import pandas as pd
import numpy as np
from sklearn.model_selection import train_test_split
from sklearn.svm import SVC
from sklearn.metrics import accuracy_score, classification_report
from google.colab import files
```

Step 2: Create or Upload a Dataset

```
# Check if the user wants to upload a file or generate one
print("Do you have a CSV file to upload? (yes/no)")
response = input().lower()
if response == "yes":
    # Upload the CSV file
    uploaded = files.upload()
    filename = list(uploaded.keys())[0]
else:
    # Generate synthetic classification data
    from sklearn.datasets import make_classification
    X, y = make_classification(n_samples=200, n_features=5, n_classes=2, random_state=42)

    # Combine features and target into a DataFrame
    data = pd.DataFrame(X, columns=[f"Feature_{i}" for i in range(X.shape[1])])
    data['Target'] = y
    # Save the synthetic dataset to a CSV file
    filename = "synthetic_data.csv"
```

```
    data.to_csv(filename, index=False)
    print(f"Synthetic dataset saved as {filename}.")
```

Step 3: Load the Dataset

```
# Load the dataset into a DataFrame
data = pd.read_csv(filename)
# Display the first few rows of the dataset
print("Dataset Preview:")
print(data.head())
```

Step 4: Preprocess the Data

```
# Separate features (X) and target (y)
X = data.iloc[:, :-1].values  # All columns except the last one
y = data.iloc[:, -1].values   # Last column as the target
# Split the dataset into training (80%) and testing (20%) sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)
```

Step 5: Train the Support Vector Machine

```
# Initialize the SVM model (use RBF kernel as default)
svm_model = SVC(kernel='rbf', C=1.0, gamma='scale', random_state=42)
# Train the SVM model on the training data
svm_model.fit(X_train, y_train)
```

Step 6: Make Predictions

```
# Predict the labels for the test set
y_pred = svm_model.predict(X_test)
```

Step 7: Evaluate the Model

```
# Calculate and print the accuracy
```

```
accuracy = accuracy_score(y_test, y_pred)
print(f"Model Accuracy: {accuracy:.2f}")

# Print a detailed classification report
print("\nClassification Report:")
print(classification_report(y_test, y_pred))
```

Step 8: Visualize the Decision Boundary (Optional for 2D Data)

```
import matplotlib.pyplot as plt
# Generate 2D synthetic data
from sklearn.datasets import make_blobs
X, y = make_blobs(n_samples=100, centers=2, random_state=42, cluster_std=1.5)
# Fit the SVM on this data
svm_model.fit(X, y)
# Plot the decision boundary
plt.figure(figsize=(8, 6))
plt.scatter(X[:, 0], X[:, 1], c=y, cmap='coolwarm', edgecolor='k')
# Create a grid to evaluate the model
xx, yy = np.meshgrid(np.linspace(X[:, 0].min(), X[:, 0].max(), 100),
                     np.linspace(X[:, 1].min(), X[:, 1].max(), 100))
Z = svm_model.decision_function(np.c_[xx.ravel(), yy.ravel()])
Z = Z.reshape(xx.shape)
# Plot the decision boundary and margins
plt.contour(xx, yy, Z, levels=[-1, 0, 1], linestyles=['--', '-', '--'], colors='k')
plt.title("SVM Decision Boundary")

4e. Train a random forest ensemble. Experiment with the number of trees and feature sampling. Compare performance to a single decision tree.

Step 1: Import Required Libraries

```
# Import necessary libraries
import pandas as pd
import numpy as np
from sklearn.model_selection import train_test_split
from sklearn.tree import DecisionTreeClassifier
from sklearn.ensemble import RandomForestClassifier
from sklearn.metrics import accuracy_score, classification_report
from google.colab import files
```

Step 2: Create or Upload a Dataset

```
# Check if the user wants to upload a file or generate one
print("Do you have a CSV file to upload? (yes/no)")
response = input().lower()
if response == "yes":
    # Upload the CSV file
    uploaded = files.upload()
    filename = list(uploaded.keys())[0]
else:
    # Generate synthetic classification data
    from sklearn.datasets import make_classification
    X, y = make_classification(n_samples=300, n_features=10, n_classes=2, random_state=42)
    # Combine features and target into a DataFrame
    data = pd.DataFrame(X, columns=[f"Feature_{i}" for i in range(X.shape[1])])
    data['Target'] = y
    # Save the synthetic dataset to a CSV file
    filename = "synthetic_data.csv"
    data.to_csv(filename, index=False)
```

```
print(f"Synthetic dataset saved as {filename}.")
```

Step 3: Load the Dataset

```
# Load the dataset
data = pd.read_csv(filename)
# Display the first few rows of the dataset
print("Dataset Preview:")
print(data.head())
```

Step 4: Preprocess the Data

```
# Separate features (X) and target (y)
X = data.iloc[:, :-1].values  # All columns except the last one
y = data.iloc[:, -1].values  # Last column as the target
# Split the dataset into training (80%) and testing (20%) sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)
```

Step 5: Train a Single Decision Tree Classifier

```
# Initialize and train the Decision Tree model
decision_tree = DecisionTreeClassifier(random_state=42)
decision_tree.fit(X_train, y_train)
# Predict and evaluate
y_pred_tree = decision_tree.predict(X_test)
accuracy_tree = accuracy_score(y_test, y_pred_tree)
print(f"Decision Tree Accuracy: {accuracy_tree:.2f}")
```

Step 6: Train a Random Forest Classifier

```
# Initialize the Random Forest model with hyperparameter tuning
random_forest = RandomForestClassifier(n_estimators=100, max_features='sqrt',
random_state=42)
```

 # Train the model

random_forest.fit(X_train, y_train)

 # Predict and evaluate

y_pred_rf = random_forest.predict(X_test)

accuracy_rf = accuracy_score(y_test, y_pred_rf)

print(f"Random Forest Accuracy (100 trees, sqrt features): {accuracy_rf:.2f}")

Step 7: Experiment with Random Forest Hyperparameters

 # Experiment with fewer trees and different feature sampling

rf_experiment = RandomForestClassifier(n_estimators=50, max_features=3, random_state=42)

rf_experiment.fit(X_train, y_train)

 # Predict and evaluate

y_pred_rf_exp = rf_experiment.predict(X_test)

accuracy_rf_exp = accuracy_score(y_test, y_pred_rf_exp)

print(f"Random Forest Accuracy (50 trees, max_features=3): {accuracy_rf_exp:.2f}")

Step 8: Compare the Models

print("\nModel Comparison:")

print(f"Decision Tree Accuracy: {accuracy_tree:.2f}")

print(f"Random Forest Accuracy (100 trees): {accuracy_rf:.2f}")

print(f"Random Forest Accuracy (50 trees, max_features=3): {accuracy_rf_exp:.2f}")

Step 9: Visualize Feature Importance (Optional)

import matplotlib.pyplot as plt

 # Extract feature importance from the Random Forest model

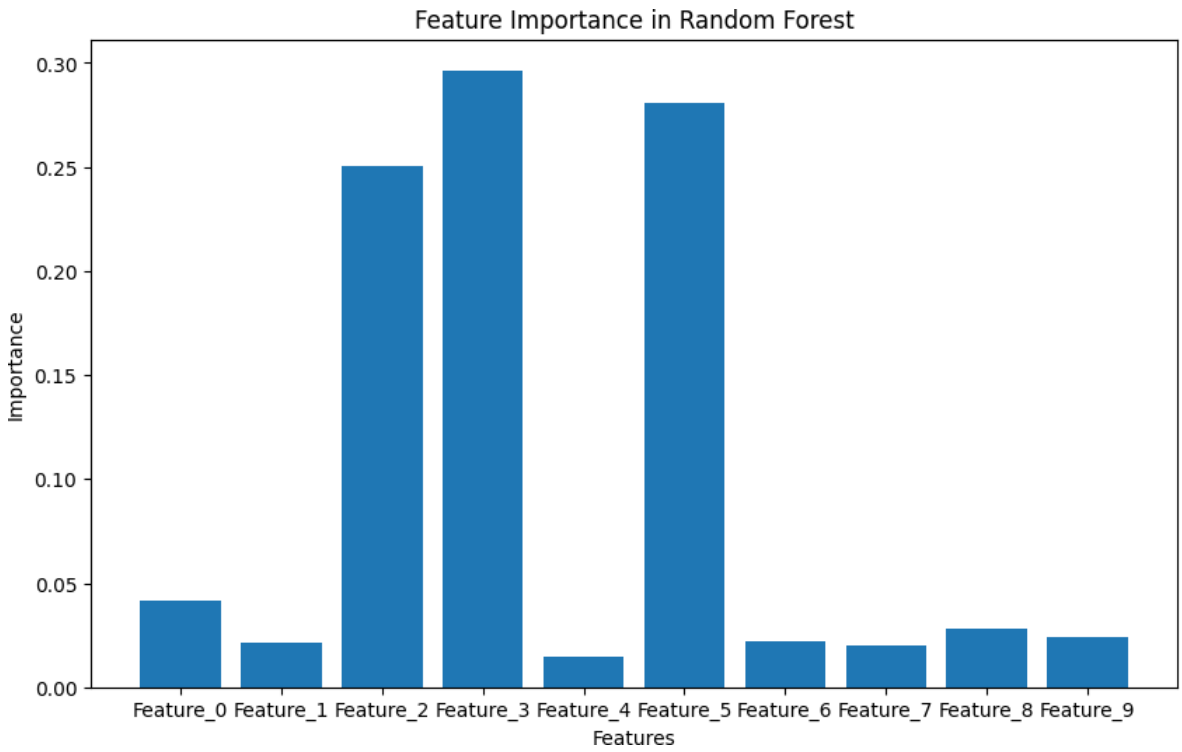
feature_importances = random_forest.feature_importances_

 # Plot the feature importance

plt.figure(figsize=(10, 6))

plt.bar(range(len(feature_importances)), feature_importances, tick_label=data.columns[:-1])

```
plt.title("Feature Importance in Random Forest")
plt.xlabel("Features")
plt.ylabel("Importance")
plt.show()
```



4f. Implement a gradient boosting machine (e.g., XGBoost). Tune hyperparameters and explore feature importance.

Step 1: Import Required Libraries

```
# Import necessary libraries
import pandas as pd
import numpy as np
from sklearn.model_selection import train_test_split, GridSearchCV
from sklearn.metrics import accuracy_score, classification_report
from xgboost import XGBClassifier, plot_importance
import matplotlib.pyplot as plt
from google.colab import files
```

Step 2: Create or Upload a Dataset

```
# Check if the user wants to upload a file or generate one
print("Do you have a CSV file to upload? (yes/no)")
response = input().lower()
if response == "yes":
    # Upload the CSV file
    uploaded = files.upload()
    filename = list(uploaded.keys())[0]
else:
    # Generate synthetic classification data
    from sklearn.datasets import make_classification
    X, y = make_classification(n_samples=300, n_features=10, n_classes=2, random_state=42)
    # Combine features and target into a DataFrame
    data = pd.DataFrame(X, columns=[f"Feature_{i}" for i in range(X.shape[1])])
    data['Target'] = y
    # Save the synthetic dataset to a CSV file
    filename = "synthetic_data.csv"
```

```
    data.to_csv(filename, index=False)
    print(f"Synthetic dataset saved as {filename}.")
```

Step 3: Load the Dataset

```
# Load the dataset
data = pd.read_csv(filename)
# Display the first few rows of the dataset
print("Dataset Preview:")
print(data.head())
```

Step 4: Preprocess the Data

```
# Separate features (X) and target (y)
X = data.iloc[:, :-1].values  # All columns except the last one
y = data.iloc[:, -1].values   # Last column as the target
# Split the dataset into training (80%) and testing (20%) sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)
```

Step 5: Train a Basic XGBoost Model

```
# Initialize and train the XGBoost model with default parameters
xgb = XGBClassifier(random_state=42)
xgb.fit(X_train, y_train)
# Predict and evaluate the model
y_pred = xgb.predict(X_test)
accuracy = accuracy_score(y_test, y_pred)
print(f"XGBoost Accuracy (Default Parameters): {accuracy:.2f}")
```

Step 6: Tune Hyperparameters with GridSearchCV

```
# Define a grid of hyperparameters
param_grid = {
```

```
    'n_estimators': [50, 100, 150],
    'learning_rate': [0.01, 0.1, 0.2],
    'max_depth': [3, 5, 7]
}
# Initialize GridSearchCV
grid_search = GridSearchCV(estimator=XGBClassifier(random_state=42),
                           param_grid=param_grid,
                           scoring='accuracy',
                           cv=3,
                           verbose=1)
# Fit the model with grid search
grid_search.fit(X_train, y_train)
# Best parameters from GridSearch
print(f"Best Parameters: {grid_search.best_params_}")
# Train the final model with the best parameters
best_xgb = grid_search.best_estimator_
# Predict and evaluate
y_pred_best = best_xgb.predict(X_test)
accuracy_best = accuracy_score(y_test, y_pred_best)
print(f"XGBoost Accuracy (Tuned Parameters): {accuracy_best:.2f}")
```

Step 7: Explore Feature Importance

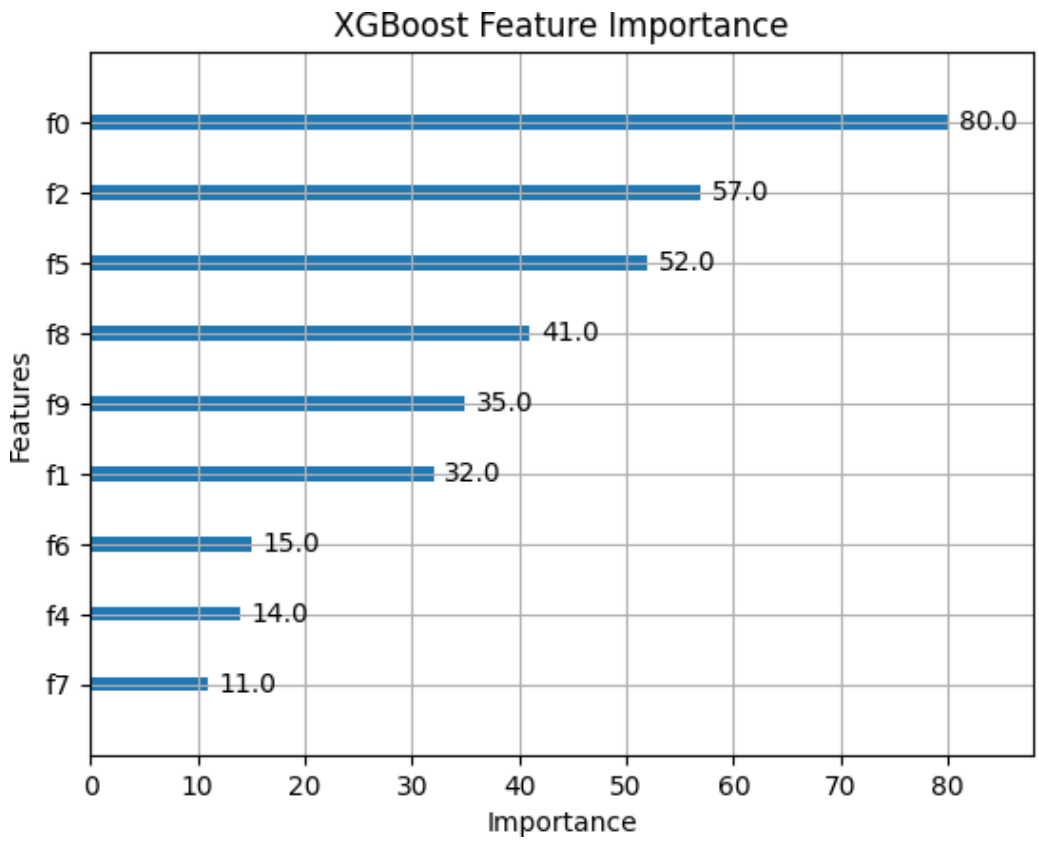
```
# Plot feature importance for the tuned model
plt.figure(figsize=(10, 6))
plot_importance(best_xgb, importance_type='weight', xlabel="Importance",
ylabel="Features")
plt.title("XGBoost Feature Importance")
plt.show()
```

Step 8: Evaluate the Model

 # Print a detailed classification report

print("Classification Report:")

print(classification_report(y_test, y_pred_best))



5a. Implement and demonstrate the working of a Naive Bayesian classifier using a sample data set. Build the model to classify a test sample.

Step 1: Import Required Libraries

```
# Import necessary libraries
import pandas as pd
import numpy as np
from sklearn.model_selection import train_test_split
from sklearn.metrics import accuracy_score, classification_report
from sklearn.naive_bayes import GaussianNB
from google.colab import files
```

Step 2: Create or Upload a Dataset

```
# Ask if the user wants to upload a file or generate one
print("Do you have a CSV file to upload? (yes/no)")
response = input().lower()
if response == "yes":
    # Upload the CSV file
    uploaded = files.upload()
    filename = list(uploaded.keys())[0]
else:
    # Generate synthetic classification data
    from sklearn.datasets import make_classification
    X, y = make_classification(n_samples=300, n_features=8, n_classes=2, random_state=42)
    # Combine features and target into a DataFrame
    data = pd.DataFrame(X, columns=[f"Feature_{i}" for i in range(X.shape[1])])
    data['Target'] = y
    # Save the synthetic dataset to a CSV file
    filename = "synthetic_naive_bayes_data.csv"
    data.to_csv(filename, index=False)
```

```
print(f"Synthetic dataset saved as {filename}.")
```

Step 3: Load the Dataset

```
# Load the dataset
data = pd.read_csv(filename)
# Display the first few rows of the dataset
print("Dataset Preview:")
print(data.head())
```

Step 4: Preprocess the Data

```
# Separate features (X) and target (y)
X = data.iloc[:, :-1].values  # All columns except the last one
y = data.iloc[:, -1].values  # Last column as the target
# Split the dataset into training (80%) and testing (20%) sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)
```

Step 5: Train a Naive Bayes Classifier

```
# Initialize the Gaussian Naive Bayes classifier
naive_bayes = GaussianNB()
# Train the model
naive_bayes.fit(X_train, y_train)
```

Step 6: Make Predictions and Evaluate

```
# Predict on the test set
y_pred = naive_bayes.predict(X_test)
# Evaluate the model
accuracy = accuracy_score(y_test, y_pred)
print(f"Naive Bayes Accuracy: {accuracy:.2f}")
# Detailed classification report
```

```
print("Classification Report:")
print(classification_report(y_test, y_pred))
```

Step 7: Test the Model with a Custom Sample

```
# Define a sample test input (replace with meaningful values based on your dataset)
test_sample = [X_test[0]]  # Taking the first test sample for demonstration
# Predict the class for the test sample
predicted_class = naive_bayes.predict(test_sample)
print(f"Test Sample: {test_sample}")
print(f"Predicted Class: {predicted_class[0]}")
```

```
Dataset Preview:

5b. Implement Hidden Markov Models using hmmlearn

Step 1: Install Required Libraries

 # Install hmmlearn

!pip install hmmlearn

Step 2: Import Required Libraries

 # Import necessary libraries

import numpy as np

import pandas as pd

from hmmlearn import hmm

import matplotlib.pyplot as plt

Step 3: Create or Load a Dataset

 # Generate synthetic observable data

np.random.seed(42)

 # Create a sequence of observations and hidden states

observations = np.random.choice(['A', 'B', 'C'], size=100, p=[0.5, 0.3, 0.2])

hidden_states = np.random.choice(['X', 'Y'], size=100, p=[0.6, 0.**4])**

 # Save the data in a DataFrame for analysis

data = pd.DataFrame({'Observations': observations, 'Hidden States': hidden_states})

print("Generated Data:")

print(data.head())

Step 4: Encode Observations

 # Encode the observations into integers

observation_mapping = {obs: idx for idx, obs in enumerate(np.unique(observations))}

encoded_observations = np.array([observation_mapping[obs] for obs in observations])

 # Print the mapping

print("Observation Encoding:")

print(observation_mapping)

Step 5: Initialize and Configure the HMM

 # Initialize the HMM model

n_states = 2 # Number of hidden states

n_observations = len(observation_mapping) # Number of unique observations

model = hmm.MultinomialHMM(n_components=n_states, random_state=42, n_iter=100, tol=0.01)

 # Define start probabilities (initial distribution of states)

start_probs = np.array([0.6, 0.4]) # Assumed probabilities

model.startprob_ = start_probs

 # Define transition probabilities between states

trans_probs = np.array([

  [0.7, 0.3], # From state X

  [0.4, 0.6], # From state Y

])

model.transmat_ = trans_probs

 # Define emission probabilities (probability of observations given states)

emission_probs = np.array([

  [0.5, 0.4, 0.1], # State X emits A, B, C

  [0.2, 0.3, 0.5], # State Y emits A, B, C

])

model.emissionprob_ = emission_probs

 # Print the configured model parameters

print("Start Probabilities:", model.startprob_)

print("Transition Matrix:", model.transmat_)

print("Emission Probabilities:", model.emissionprob_)

Step 6: Train the Model

```
# Reshape the data for HMM (requires 2D array)
encoded_observations = encoded_observations.reshape(-1, 1)
# Fit the model
model.fit(encoded_observations)
# Predict hidden states for the observations
predicted_states = model.predict(encoded_observations)
# Print the predicted states
print("Predicted States:")
print(predicted_states)
```

Step 7: Visualize the Results

```
# Map predicted states back to their original labels
state_mapping = {0: 'X', 1: 'Y'}
predicted_state_labels = [state_mapping[state] for state in predicted_states]
# Add predicted states to the DataFrame
data['Predicted States'] = predicted_state_labels
# Display the first few rows with predicted states
print("Data with Predicted States:")
print(data.head())
# Plot the observations and predicted states
plt.figure(figsize=(12, 6))
plt.plot(data['Observations'], label='Observations', marker='o', linestyle='-', alpha=0.7)
plt.plot(data['Predicted States'], label='Predicted States', marker='x', linestyle='--', alpha=0.7)
plt.legend()
plt.title("Observations and Predicted States")
plt.xlabel("Time")
plt.ylabel("Value")
plt.show()
```

6. Probabilistic Models

6a. Implement Bayesian Linear Regression to explore prior and posterior distribution.

Bayesian Linear Regression is a probabilistic approach to linear regression that incorporates uncertainty in the model parameters. Instead of estimating point values for parameters (as in traditional linear regression), we estimate distributions over the parameters.

Step 1: Install Required Libraries

 # Install necessary libraries

```
!pip install matplotlib seaborn scikit-learn
```

Step 2: Import Required Libraries

 # Import necessary libraries

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
from sklearn.linear_model import BayesianRidge
from sklearn.model_selection import train_test_split
from sklearn.metrics import mean_squared_error
from google.colab import files
```

Step 3: Create or Upload a Dataset

 # Upload a CSV file if you have one

```
print("Do you have a CSV file to upload? (yes/no)")
response = input().lower()
if response == "yes":
    # Upload the CSV file
    uploaded = files.upload()
```

```
    filename = list(uploaded.keys())[0]
else:
    # Generate synthetic data for demonstration
    np.random.seed(42)
    X = np.random.rand(100, 1) * 10  # Random data between 0 and 10
    y = 2 * X + 1 + np.random.randn(100, 1) * 2  # y = 2x + 1 with some noise
    # Convert to a DataFrame
    data = pd.DataFrame(np.hstack((X, y)), columns=["X", "y"])
    # Save to CSV for convenience
    filename = "synthetic_data.csv"
    data.to_csv(filename, index=False)
    print(f"Synthetic dataset saved as {filename}.")
```

Step 4: Load and Explore the Data

```
# Load the dataset (for CSV file)
data = pd.read_csv(filename)
# Display first few rows
print("Dataset Preview:")
print(data.head())
```

Step 5: Preprocess the Data

```
# Separate features (X) and target (y)
X = data["X"].values.reshape(-1, 1)  # Feature matrix
y = data["y"].values  # Target vector
# Split the dataset into training (80%) and testing (20%) sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)
```

Step 6: Implement Bayesian Linear Regression Model

```
# Initialize the BayesianRidge model (which implements Bayesian Linear Regression)
```

```
bayesian_regressor = BayesianRidge()
# Fit the model on the training data
bayesian_regressor.fit(X_train, y_train)
# Predict on the test data
y_pred = bayesian_regressor.predict(X_test)
```

Step 7: Visualize the Prior and Posterior Distributions

```
# Plot the prior and posterior distributions of the parameters
fig, ax = plt.subplots(1, 2, figsize=(12, 6))
# Plot prior distribution (assuming the model starts with a standard prior)
ax[0].set_title("Prior Distribution (Assumed)")
ax[0].hist(np.random.normal(0, 1, 1000), bins=50, alpha=0.7, color='blue', label="Prior")
ax[0].legend()
# Plot posterior distribution (after model fitting)
ax[1].set_title("Posterior Distribution (After Fitting)")
ax[1].hist(bayesian_regressor.coef_, bins=50, alpha=0.7, color='green', label="Posterior")
ax[1].legend()
plt.show()
```

Step 8: Evaluate the Model Performance

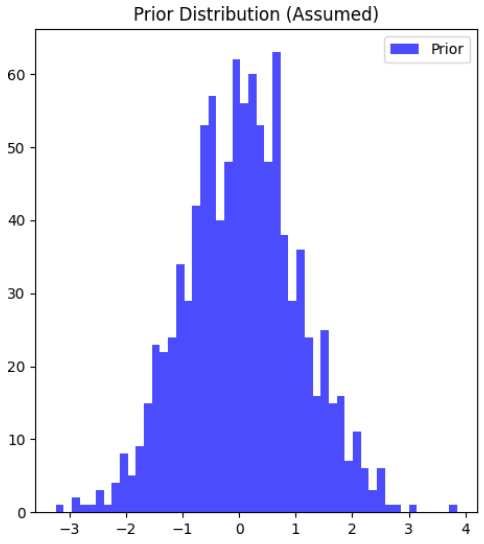
```
# Calculate the Mean Squared Error (MSE)
mse = mean_squared_error(y_test, y_pred)
print(f"Mean Squared Error (MSE): {mse:.2f}")
```

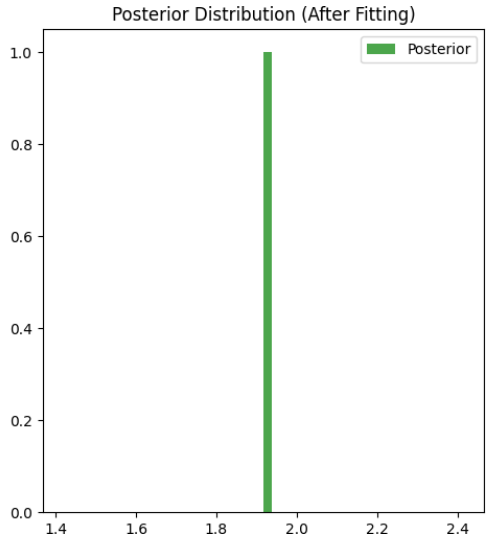
Step 9: Visualize the Fit of the Model

```
# Plot the true values and the predicted values
plt.figure(figsize=(8, 6))
plt.scatter(X_test, y_test, color="blue", label="True values")
plt.plot(X_test, y_pred, color="red", label="Predicted values", linewidth=2)
```

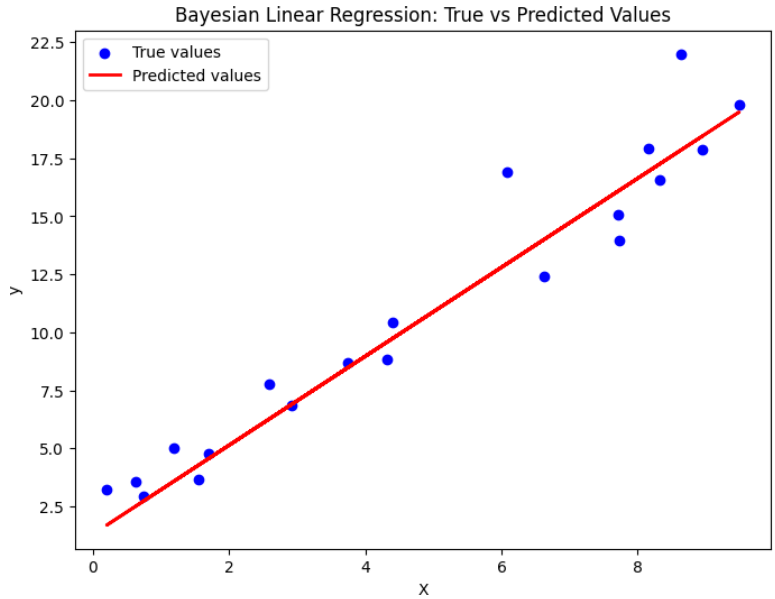
```
plt.title("Bayesian Linear Regression: True vs Predicted Values")
plt.xlabel("X")
plt.ylabel("y")
plt.legend()
plt.show()
```

Mean Squared Error (MSE): 3.9





2



6b. Implement Gaussian Mixture Models for density estimation and unsupervised clustering.

Step 1: Install Required Libraries

 # Install required libraries

```
!pip install matplotlib seaborn scikit-learn
```

Step 2: Import Required Libraries

 # Import necessary libraries

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
from sklearn.mixture import GaussianMixture
from sklearn.model_selection import train_test_split
from google.colab import files
```

Step 3: Create or Upload a Dataset

 # Ask if the user has a CSV file to upload

```
print("Do you have a CSV file to upload? (yes/no)")
response = input().lower()
if response == "yes":
    # Upload the CSV file
    uploaded = files.upload()
    filename = list(uploaded.keys())[0]
else:
    # Generate synthetic 2D data with two clusters for demonstration
    np.random.seed(42)
  # Generate data for two Gaussian distributions
    X1 = np.random.normal(loc=0, scale=1, size=(300, 2))  # Cluster 1: mean = 0, std = 1
    X2 = np.random.normal(loc=5, scale=1, size=(300, 2))  # Cluster 2: mean = 5, std = 1
```

```
# Stack the data to create a dataset
X = np.vstack([X1, X2])
# Create DataFrame to simulate the CSV file for consistency
data = pd.DataFrame(X, columns=["Feature_1", "Feature_2"])
filename = "synthetic_data.csv"
data.to_csv(filename, index=False)
print(f"Synthetic dataset saved as {filename}.")
```

Step 4: Load and Explore the Dataset

```
# Load the dataset (if CSV file is uploaded)
data = pd.read_csv(filename)
# Display the first few rows
print("Dataset Preview:")
print(data.head())
# Plot the data to visualize its structure
sns.scatterplot(data=data, x="Feature_1", y="Feature_2")
plt.title("Synthetic Data")
plt.xlabel("Feature 1")
plt.ylabel("Feature 2")
plt.show()
```

Step 5: Fit a Gaussian Mixture Model (GMM)

```
# Define the GMM model
n_components = 2  # Number of Gaussian distributions (clusters)
gmm = GaussianMixture(n_components=n_components, covariance_type='full',
random_state=42)
# Fit the GMM model to the data
gmm.fit(data)
# Predict the cluster labels for each data point
```

```
labels = gmm.predict(data)

# Add the cluster labels to the dataset for visualization

data['Cluster'] = labels

# Plot the clustered data

sns.scatterplot(data=data, x="Feature_1", y="Feature_2", hue="Cluster", palette="viridis", marker="o")

plt.title("Gaussian Mixture Model Clustering")

plt.xlabel("Feature 1")

plt.ylabel("Feature 2")

plt.legend()

plt.show()
```

Step 6: Visualize the Gaussian Mixture Model (GMM) Components

```
# Extract the means and covariances of the Gaussian components

means = gmm.means_

covariances = gmm.covariances_

# Plot the GMM components on top of the data

plt.figure(figsize=(8, 6))

# Plot data points

sns.scatterplot(data=data, x="Feature_1", y="Feature_2", hue="Cluster", palette="viridis", marker="o", s=60, alpha=0.7)

# Plot the GMM ellipses

for mean, covar in zip(means, covariances):
    # Plot the Gaussian components as ellipses
    v, w = np.linalg.eigh(covar)
    v = 2.0 * np.sqrt(2.0) * np.sqrt(v)  # Scaling factor for the ellipse
    u = w[0] / np.linalg.norm(w[0])  # Normalize the eigenvector
    angle = np.arctan(u[1] / u[0])
    # Create the ellipse
    angle = angle * 180.0 / np.pi  # Convert to degrees
```

```
    ellipse = plt.matplotlib.patches.Ellipse(mean, v[0], v[1], angle=angle, color='red',
alpha=0.3)
    plt.gca().add_patch(ellipse)

plt.title("GMM Clustering with Gaussian Components")
plt.xlabel("Feature 1")
plt.ylabel("Feature 2")
plt.legend()
plt.show()
```

Step 7: Model Evaluation (Optional)

```
# Compute the log-likelihood of the data under the fitted GMM model
log_likelihood = gmm.score(data)
print(f"Log-Likelihood of the data: {log_likelihood:.2f}")
```

Step 8: Predict New Data Points

```
# Example of predicting the cluster for new data points
new_data = np.array([[1.5, 2.5], [4.5, 5.5], [7.0, 8.0]])
new_labels = gmm.predict(new_data)
# Print the predicted clusters for the new data points
print("Predicted Clusters for New Data Points:")
for i, label in enumerate(new_labels):
    print(f"Data point {new_data[i]} is in Cluster {label}")
```

7. Model Evaluation and Hyperparameter Tuning

a. Implement cross-validation techniques (k-fold, stratified, etc.) for robust model evaluation

1. Import Necessary Libraries

```
import numpy as np
import pandas as pd
from sklearn.datasets import make_classification
from sklearn.model_selection import train_test_split, KFold, StratifiedKFold, GridSearchCV
from sklearn.ensemble import RandomForestClassifier
from sklearn.metrics import accuracy_score, classification_report, confusion_matrix
import matplotlib.pyplot as plt
import seaborn as sns
```

2. Generate a Synthetic Dataset

```
# Create a synthetic dataset with 2 classes
X, y = make_classification(
    n_samples=1000, n_features=10, n_informative=8, n_redundant=2,
    n_clusters_per_class=1, random_state=42
)
# Convert to a DataFrame for visualization
df = pd.DataFrame(X, columns=[f'Feature_{i}' for i in range(1, 11)])
df['Target'] = y
# Display the first few rows
print(df.head())
```

3. Split Data into Train and Test Sets

```
# Split data into 80% training and 20% testing
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42,
stratify=y)
```

4. Define k-Fold Cross-Validation

```
kf = KFold(n_splits=5, shuffle=True, random_state=42)
print("k-Fold Cross-Validation:")
for train_index, val_index in kf.split(X_train):
    print("TRAIN:", train_index, "VALIDATION:", val_index)
```

5. Define Stratified k-Fold Cross-Validation

```
skf = StratifiedKFold(n_splits=5, shuffle=True, random_state=42)
print("\nStratified k-Fold Cross-Validation:")
for train_index, val_index in skf.split(X_train, y_train):
    print("TRAIN:", train_index, "VALIDATION:", val_index)
```

6. Train and Evaluate Using k-Fold Cross-Validation

```
# Initialize model
model = RandomForestClassifier(random_state=42)
```

 # Perform k-Fold Cross-Validation

```
accuracies = []
for train_index, val_index in kf.split(X_train):
    X_kf_train, X_kf_val = X_train[train_index], X_train[val_index]
    y_kf_train, y_kf_val = y_train[train_index], y_train[val_index]

    # Train model
    model.fit(X_kf_train, y_kf_train)

    # Validate model
    y_pred = model.predict(X_kf_val)
    accuracy = accuracy_score(y_kf_val, y_pred)
    accuracies.append(accuracy)
print(f"Average Accuracy from k-Fold: {np.mean(accuracies):.2f}")
```

7. Hyperparameter Tuning Using GridSearchCV

```
# Define parameter grid
param_grid = {
    'n_estimators': [50, 100, 200],
    'max_depth': [None, 10, 20, 30],
    'min_samples_split': [2, 5, 10],
}

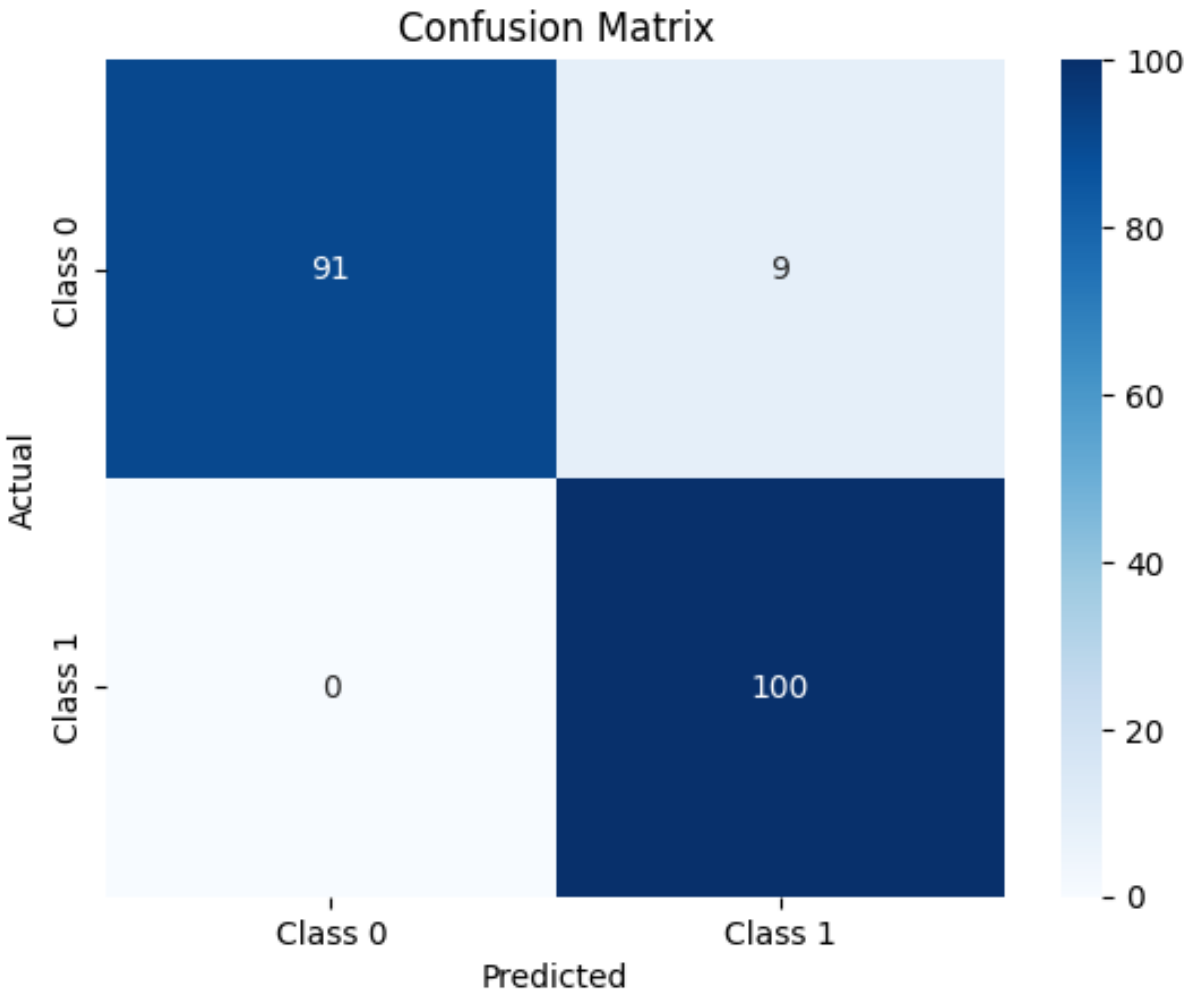
# Perform GridSearchCV with Stratified k-Fold
grid_search = GridSearchCV(
    estimator=RandomForestClassifier(random_state=42),
    param_grid=param_grid,
    cv=StratifiedKFold(n_splits=5, shuffle=True, random_state=42),
    scoring='accuracy',
    n_jobs=-1,
    verbose=1
)

# Fit to training data
grid_search.fit(X_train, y_train)
print("Best Parameters:", grid_search.best_params_)
print("Best Cross-Validation Accuracy:", grid_search.best_score_)
```

8. Evaluate the Final Model

```
# Use the best model for evaluation
best_model = grid_search.best_estimator_
# Predict on test data
y_test_pred = best_model.predict(X_test)
# Evaluate performance
print("\nTest Accuracy:", accuracy_score(y_test, y_test_pred))
print("\nClassification Report:\n", classification_report(y_test, y_test_pred))
# Confusion matrix
conf_matrix = confusion_matrix(y_test, y_test_pred)
sns.heatmap(conf_matrix, annot=True, fmt='d', cmap='Blues', xticklabels=['Class 0', 'Class 1'],
yticklabels=['Class 0', 'Class 1'])
plt.xlabel('Predicted')
```

```
plt.ylabel('Actual')
plt.title('Confusion Matrix')
plt.show()
```



7b. Systematically explore combinations of hyperparameters to optimize model performance.(use grid and randomized search)

1. Import Necessary Libraries

```
import numpy as np
import pandas as pd
from sklearn.datasets import make_classification
from sklearn.model_selection import train_test_split, GridSearchCV, RandomizedSearchCV,
StratifiedKFold
from sklearn.ensemble import RandomForestClassifier
from sklearn.metrics import accuracy_score, classification_report, confusion_matrix
import matplotlib.pyplot as plt
import seaborn as sns
```

2. Generate a Synthetic Dataset

```
# Generate a binary classification dataset
X, y = make_classification(
    n_samples=1000, n_features=12, n_informative=8, n_redundant=2,
    n_clusters_per_class=1, flip_y=0.03, random_state=42
)
# Convert to a DataFrame for visualization
df = pd.DataFrame(X, columns=[f'Feature_{i}' for i in range(1, 13)])
df['Target'] = y
# Display the first few rows
print(df.head())
```

3. Split Data into Train and Test Sets

```
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42,
stratify=y)
```

4. Define the Model

```
# Initialize a Random Forest classifier
model = RandomForestClassifier(random_state=42)
```

5. Hyperparameter Tuning Using Grid Search

```
# Define a parameter grid for Grid Search
param_grid = {
    'n_estimators': [50, 100, 200],
    'max_depth': [None, 10, 20],
    'min_samples_split': [2, 5, 10],
    'min_samples_leaf': [1, 2, 4]
}
# GridSearchCV with 5-fold cross-validation
grid_search = GridSearchCV(
    estimator=model,
    param_grid=param_grid,
    scoring='accuracy',
```

```
    cv=StratifiedKFold(n_splits=5, shuffle=True, random_state=42),
    verbose=1,
    n_jobs=-1
)
# Fit the model
grid_search.fit(X_train, y_train)

# Best parameters and score from Grid Search
print("Best Parameters from Grid Search:", grid_search.best_params_)
print("Best Cross-Validation Accuracy from Grid Search:", grid_search.best_score_)
```

6. Hyperparameter Tuning Using Randomized Search

```
from scipy.stats import randint
# Define a parameter distribution for Randomized Search
param_dist = {
    'n_estimators': randint(50, 300),
    'max_depth': [None, 10, 20, 30],
    'min_samples_split': randint(2, 15),
    'min_samples_leaf': randint(1, 10)
}
# RandomizedSearchCV with 5-fold cross-validation
random_search = RandomizedSearchCV(
    estimator=model,
    param_distributions=param_dist,
    n_iter=50,  # Number of random combinations to try
    scoring='accuracy',
    cv=StratifiedKFold(n_splits=5, shuffle=True, random_state=42),
    verbose=1,
    n_jobs=-1,
    random_state=42
)
# Fit the model
random_search.fit(X_train, y_train)

# Best parameters and score from Randomized Search
print("Best Parameters from Randomized Search:", random_search.best_params_)
print("Best Cross-Validation Accuracy from Randomized Search:",
random_search.best_score_)
```

7. Evaluate the Best Model

```
# Select the best model from Grid Search and Randomized Search
best_model = random_search.best_estimator_  # Or use grid_search.best_estimator_

# Predict on test data
y_test_pred = best_model.predict(X_test)

# Evaluate the performance
print("\nTest Accuracy:", accuracy_score(y_test, y_test_pred))
print("\nClassification Report:\n", classification_report(y_test, y_test_pred))
```

 # Confusion Matrix

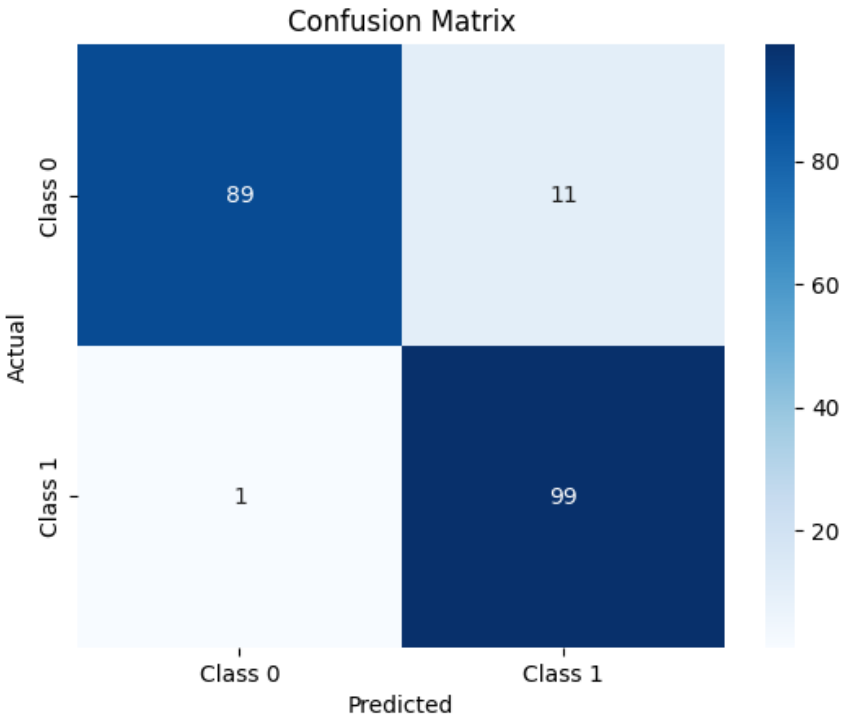
```
conf_matrix = confusion_matrix(y_test, y_test_pred)
sns.heatmap(conf_matrix, annot=True, fmt='d', cmap='Blues', xticklabels=['Class 0', 'Class 1'],
yticklabels=['Class 0', 'Class 1'])
plt.xlabel('Predicted')
plt.ylabel('Actual')
plt.title('Confusion Matrix')
plt.show()
```

```
Test Accuracy: 0.94

Classification Report:
              precision    recall  f1-score   support

           0       0.99      0.89      0.94       100
           1       0.90      0.99      0.94       100

    accuracy                           0.94       200
   macro avg       0.94      0.94      0.94       200
weighted avg       0.94      0.94      0.94       200
```



8. Implement Bayesian Learning using inferences

1. Import Necessary Libraries

```
import numpy as np
import pandas as pd
from sklearn.datasets import make_classification
from sklearn.model_selection import train_test_split
from sklearn.naive_bayes import GaussianNB
from sklearn.metrics import accuracy_score, classification_report, confusion_matrix
import seaborn as sns
import matplotlib.pyplot as plt
```

2. Generate a Synthetic Dataset

```
# Generate a dataset with 2 classes
X, y = make_classification(
    n_samples=1000, n_features=8, n_informative=6, n_redundant=2,
    n_classes=2, random_state=42
)
# Convert to DataFrame for visualization
df = pd.DataFrame(X, columns=[f'Feature_{i}' for i in range(1, 9)])
df['Target'] = y

# Display the first few rows
print(df.head())
```

3. Split the Dataset

```
# Split data into 80% training and 20% testing
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42,
stratify=y)
```

4. Bayesian Learning with Naive Bayes

```
# Initialize the Gaussian Naive Bayes model
model = GaussianNB()

# Fit the model to the training data
model.fit(X_train, y_train)

# Predict on the test data
y_pred = model.predict(X_test)
```

5. Evaluate the Model

```
# Calculate accuracy
accuracy = accuracy_score(y_test, y_pred)
print(f"Test Accuracy: {accuracy:.2f}")

# Print classification report
print("\nClassification Report:\n", classification_report(y_test, y_pred))
```

 # Generate and plot confusion matrix

```
conf_matrix = confusion_matrix(y_test, y_pred)
sns.heatmap(conf_matrix, annot=True, fmt='d', cmap='Blues', xticklabels=['Class 0', 'Class 1'],
yticklabels=['Class 0', 'Class 1'])
plt.xlabel('Predicted')
plt.ylabel('Actual')
plt.title('Confusion Matrix')
plt.show()
```

6. Understanding Bayesian Inference

In Bayesian Learning, the model predicts based on the probabilities:

- Prior Probability (P(C)P(C)P(C)): The likelihood of each class based on historical data.
- Likelihood (P(X|C)P(X|C)P(X|C)): The probability of the data given a class.
- Posterior Probability (P(C|X)P(C|X)P(C|X)): Calculated using Bayes' theorem: P(C|X)=P(X|C)·P(C)P(X)P(C|X) = \frac{P(X|C) \cdot P(C)}{P(X)}P(C|X)=P(X)P(X|C)·P(C)

 # Example: Compute posterior probabilities for the first test sample

```
sample = X_test[0].reshape(1, -1)
posterior_probs = model.predict_proba(sample)

print(f"Sample Features: {sample}")
print(f"Posterior Probabilities: {posterior_probs}")
print(f"Predicted Class: {model.predict(sample)}")
```

```
Test Accuracy: 0.84

Classification Report:
              precision    recall  f1-score   support

           0       0.88      0.80      0.84        99
           1       0.82      0.89      0.85       101

    accuracy                           0.84       200
   macro avg       0.85      0.84      0.84       200
weighted avg       0.85      0.84      0.84       200
```
